

# CS 33: Introduction to Computer Organization

TA: Aalisha Dalal

LA: Jonathan Myong

Office Hours: Friday, 9:30-11:30AM

# Quick Introduction

# Motivation for the Course

- At the granular level, everything in a computer is done using digital circuits which is done using bitwise operations.
- Foundation for Operation Systems.
- Prevent security attacks
- To write efficient code by using parallelization

# Focus of the Discussion

- Bits and Integers
- Worksheet Problems

# Bitwise vs. logical Operators in C

Bitwise operator	Logical Operator
&,  , ~, ^	&&,   , !
Bitwise operation on datatypes	Evaluates expression to true or false with short-circuiting behavior

# How are negative numbers stored?

Most popular approach is using Two's complement form

**Example:** Two's complement of 133

# Dividing by Power of 2 - Shift Operator

---

For positive numbers:  $\lfloor u/2^k \rfloor$

For negative numbers:  $\lceil u/2^k \rceil$

How do we achieve this?

# Big Endian vs. Little Endian

## ■ Example

- Variable x has 4-byte value of 0x01234567
- Address given by &x is 0x100

### Big Endian

		0x100	0x101	0x102	0x103		
		01	23	45	67		

### Little Endian

		0x100	0x101	0x102	0x103		
		67	45	23	01		

# Signed & Unsigned Int

- Easy to make mistakes

```
unsigned i;  
for (i = cnt-2; i >= 0; i--)  
    a[i] += a[i+1];
```

- Can be very subtle

```
#define DELTA sizeof(int)  
int i;  
for (i = CNT; i-DELTA >= 0; i-= DELTA)  
    . . .
```

# Integer Puzzles

## Initialization

```
int x = foo();  
int y = bar();  
unsigned ux = x;  
unsigned uy = y;
```

<code>x &lt; 0</code>	$\Rightarrow$	<code>((x*2) &lt; 0)</code>
<code>ux &gt;= 0</code>		
<code>x &amp; 7 == 7</code>	$\Rightarrow$	<code>(x&lt;&lt;30) &lt; 0</code>
<code>ux &gt; -1</code>		
<code>x &gt; y</code>	$\Rightarrow$	<code>-x &lt; -y</code>
<code>x * x &gt;= 0</code>		
<code>x &gt; 0 &amp;&amp; y &gt; 0</code>	$\Rightarrow$	<code>x + y &gt; 0</code>
<code>x &gt;= 0</code>	$\Rightarrow$	<code>-x &lt;= 0</code>
<code>x &lt;= 0</code>	$\Rightarrow$	<code>-x &gt;= 0</code>
<code>(x -x)&gt;&gt;31 == -1</code>		
<code>ux &gt;&gt; 3 == ux/8</code>		
<code>x &gt;&gt; 3 == x/8</code>		
<code>x &amp; (x-1) != 0</code>		

# Appendix

C Data Type	Typical 32-bit	Typical 64-bit	x86-64
<code>char</code>	1	1	1
<code>short</code>	2	2	2
<code>int</code>	4	4	4
<code>long</code>	4	8	8
<code>float</code>	4	4	4
<code>double</code>	8	8	8
<code>long double</code>	–	–	10/16
<code>pointer</code>	4	8	8
